Business Requirements Document

PayTrack | Payment Reconciliation & Exception Management

SAMPLE ONLY — FICTIONAL PORTFOLIO CASE STUDY. All names, records, targets, dates and amounts are illustrative, not evidence of actual client work.

Document version 1.0 | Scenario: PayTrack payment reconciliation portal | Owner: Sample Business Analyst

1. Executive summary

PayTrack is a fictional internal operations portal concept intended to help an operations team compare internal payment records with payment-gateway events, identify unmatched or inconsistent records, assign exceptions, document resolutions and preserve an audit trail. This BRD frames the business need and desired outcomes before detailed solution design.

2. Business context and problem statement

In the illustrative current state, operations staff use separate gateway reports, internal transaction exports and manual trackers. The resulting workflow can create duplicated effort, delayed identification of mismatches, inconsistent ownership and limited visibility into why a transaction remains unresolved. These are scenario assumptions for this sample; a real engagement would validate them through interviews, observation and data assessment.

3. Objectives and proposed success measures

ID	Objective	Illustrative pilot measure / target
OBJ-01	Improve reconciliation visibility	At least 95% of eligible transactions matched automatically in pilot; validate baseline first.
OBJ-02	Make exception ownership explicit	100% of open exceptions have status, owner or queue, reason code and last-updated timestamp.
OBJ-03	Improve investigation consistency	At least 90% of sampled cases can be triaged by an analyst within two minutes; measure in UAT.
OBJ-04	Provide traceable actions	100% of resolution and reassignment actions create an audit event.

4. Stakeholders and user groups

Stakeholder / role	Interest / responsibility
Operations Analyst	Monitor exceptions, compare source values, add evidence and record permitted resolutions.
Operations Lead	Manage queue, reassign work, review escalations and approve controlled actions when policy requires.
Support / Read-only User	View transaction status and audit-relevant information without changing records.

Stakeholder / role	Interest / responsibility
Product Owner / Business Sponsor	Confirm business outcomes, policy rules, priorities and scope decisions.
Engineering / QA	Design the solution, implement controls and validate requirements against acceptance criteria.
Security / Platform Owner	Confirm access, logging, retention and operational requirements.

5. Scope

In scope

- Import or receive normalized internal transaction and gateway event data for a defined reconciliation window.
- Match records using agreed reference fields and configured matching rules.
- Show matched, pending, unmatched, duplicate and failed items with reason codes.
- Create and assign exception cases with comments/evidence references and controlled status changes.
- Record user actions, timestamps, status transitions and relevant before/after values in an audit history.
- Provide filters, search, summary counts and export of permitted operational views.

Out of scope for the sample

- Initiating refunds, payouts or payment capture from this portal.
- Making autonomous financial decisions or changing gateway records without authorization.
- Connecting to a real payment provider, production credentials or real customer information.
- Defining legal retention, PCI scope or regulated-data policies without stakeholder/security review.

6. High-level business requirements

ID	Business requirement	Priority
BR-01	The portal shall provide a single operational view of transaction and reconciliation status.	Must
BR-02	The portal shall identify unmatched or inconsistent records with an actionable reason code.	Must
BR-03	The portal shall enable authorised users to assign, comment on and resolve exception cases.	Must
BR-04	The portal shall preserve an audit history for material case and transaction actions.	Must
BR-05	The portal shall restrict actions based on a role and permission model.	Must
BR-06	The portal shall provide filters and search for operational triage.	Should
BR-07	The portal should allow permitted case/transaction results to be exported.	Could
BR-08	The portal shall surface failures in ingestion or reconciliation so the team can investigate.	Should

7. Assumptions, constraints and dependencies

- Source records contain a stable transaction reference or an agreed composite matching key.
- The gateway integration method, rate limits, event schema and retry behavior are to be confirmed.

- The first release is an operations-facing pilot; production scale and hosting are not specified here.
- Access roles, resolution authority, audit retention and export rules require sponsor/security approval.
- Illustrative merchant names, IDs, dates, amounts and success thresholds are invented for portfolio demonstration.

8. Risks and mitigations

Risk	Potential impact	Mitigation / discovery action
Inconsistent reference data	False unmatched or incorrect matches	Profile source records; agree deterministic match keys; maintain exception reasons.
Duplicate or delayed gateway events	Incorrect status or repeated work	Define idempotency key, event ordering, retry policy and duplicate handling.
Unclear resolution authority	Unauthorised changes or audit findings	Approve role matrix and escalation/approval rules before build.
Unclear baseline metrics	Targets cannot be assessed fairly	Capture current volumes, touch time, mismatch rates and reporting delays before pilot.

9. Acceptance and sign-off approach

Business sign-off would confirm the problem statement, scope, role model, priority requirements, baseline measurement plan and open policy decisions. This sample is not a signed or approved client BRD.

Role	Name / date	Status
Business Sponsor	To be completed	Pending
Operations Lead	To be completed	Pending
Product Owner	To be completed	Pending
Security / Platform	To be completed	Pending
